

ISO 9001 CHECKLIST

Quality Management System

ISO 9001 Checklist

If you are currently engaged in the process of implementing a Quality Management System (QMS) with the aim of obtaining ISO 9001 certification, this checklist serves as a valuable tool to evaluate your adherence and pinpoint areas that may need further attention.

Although this checklist is not exhaustive, it covers the key areas under clauses 4 - 10 of ISO 9001 that you need to consider to support you on your journey to certification.

You may notice repetition across this checklist with other ISO standard checklists. This is because many are built using the same Annex SL structure, meaning there are commonalities across multiple standards to facilitate integration of management systems.

Our team are here to support you on your journey to certification. For more information, check out page 14 of this document.

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
4.2	Register of interested parties - It is important to identify all interested parties that may rely upon or have inputs to your Quality Management System (QMS), and to understand their needs and expectations. This may include statutory or regulatory bodies, business insurers, professional trade bodies and others. It is not uncommon for a Board, shareholders and employees to be included, as they all have an interest in the quality posture of your organisation and how that ultimately contributes to success.				
4.3	Scope of the QMS - The "Scope" of your QMS records the areas within your organisation which are covered by your QMS, and also identifies any which are not to be included. This scope may include specific details such as the products and services being provided and the locations from which quality-related activities are delivered. The scope will be used by your assessment organisation and documented on any ISO 9001 certificate which they subsequently issue to you.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
5.2, 6.2	Quality Policy and Quality Objectives - Your Quality Policy details your organisation's aims and commitments with regard to satisfying your key stakeholder requirements for delivering (and maintaining) products or services of acceptable quality levels. It will describe the measures and rules you require to comply with, to enable you to achieve those aims and commitments. Quality objectives should be identified, set and monitored to demonstrate how your organisation intends to continually improve and derive benefit from its QMS.				
7.1, 5.2	Monitoring and measuring equipment calibration records - If your organisation uses technical equipment to assess product or service conformance (e.g., scales, metres or gauges), ISO 9001 requires you to uniquely identify each piece of equipment and ensure that each is properly calibrated or verified at specified intervals to ensure its ongoing accuracy. Furthermore, such equipment must be protected to prevent it from being poorly adjusted or damaged, which would then effect the conformity of the product or service being measured. Documents and records to demonstrate the proper management of measuring equipment and technologies should be kept.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
7.2 (d)	Records of training, skills, experience and/or qualifications - To implement and operate an effective QMS, it will be important to identify and assign key responsibilities to some of your organisation's personnel. For them to effectively deliver these responsibilities, it will be necessary to demonstrate that such personnel have an appropriate level of training, skills and experience and that these can be evidenced through supporting materials including professional qualifications, training certificates, records of previous experience, etc.				
7.3	Evidence of communication of quality awareness - Suitable training and awareness materials should be made available. These should include references to your Quality Policy and Quality Objectives, and specifically how individuals can comply with the requirements of the policy and contribute to the successful achievement of the objectives. It is recommended that records of having provided awareness communications and training are maintained.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
7.5	Document management and record control procedure - ISO 9001 specifies a set of characteristics to help your organisation manage the policies and procedures (a) required by the standard, and (b) created by your organisation to support quality objectives. This includes how documents are identified, reviewed, approved, made available to personnel, retained and disposed of, amongst others. Similar considerations will be needed for the records which are produced to demonstrate that quality-related activities have been undertaken.				
8.2, 3.2	Records of reviews of products or services requirements - Your organisation will need to conduct reviews to determine whether it can meet customer requirements for specified products or services. ISO 9001 requires you to keep records of such reviews to demonstrate that they have taken place, as well as clearly recording any newly identified requirements for such products or services.				
8.3, 2 (j)	Records of design and development outputs - As your organisation plans the stages of design and development of your products and services, one of the requirements required by your QMS will be to ensure that appropriate documented information is produced to provide evidence that all applicable requirements have been met.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
8.3.3	Design and development inputs - Each ISO management system standard requires an organisation to plan for and undertake regular internal audits, to ensure that its is regularly checking how well it is achieving its objectives. Your organisation's internal audit activities should be planned in advance. The results of each internal audit activity should be documented and reviewed, such that any corrective actions or improvement opportunities can be identified, recorded and implemented as required.				
8.3.4	Design and development controls - As you refine your design and development activities, it will be important to consider controls which will help you to (a) define the results that are to be achieved, (b) ensure that regular reviews are being conducted, (c) ensure that design and development actual outputs meet specific input requirements, (d) validation checks are in place to ensure that products or services are suitable for their intended use, and (e) take action on any problems identified during reviews or checks. Documents and records of these "control activities" should be kept.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
8.3.5	Design and development outputs - As your organisation completes its design and development activities, records should be kept to demonstrate that outputs (a) meet the design and development input requirements, (b) are adequate for subsequent processes using the products or services, (c) make reference to any monitoring and measuring activities that have taken place during production/provision, and (d) the products and services can achieve their intended purpose in a safe and compliant manner.				
8.3.6	Design and development changes - If during design and development activities, your organisation identifies that changes are required, records should be created to highlight these proposed changes, evidence of reviews of the proposed changes, authorisation for the changes to be made, and an assessment to demonstrate that the changes will not have a negative consequence on the products or services being designed and developed.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
8.4.1	Documented criteria for evaluating and selecting suppliers - A formal approach to the evaluation of a supplier's capabilities should be undertaken before they are permitted to support any part of your organisation's quality activities for designing, manufacturing, delivering or supporting its products or services. You need to monitor ongoing supplier performance on a regular basis, and be prepared to review decisions if necessary. The ISO 9001 standard requires you to document how you evaluate and select your suppliers, including any resulting decisions and actions.				
8.5.1	Documented characteristics of products or services - To ensure that production or provision can proceed as planned, ISO 9001 requires these to take place under controlled conditions. This includes, for example, the availability of (a) documented information, (b) monitoring and/measuring processes and equipment (c) appropriate infrastructure and safe operating environments, (d) competent, experienced and qualified personnel, (e) validation of the products produced or services provided and (f) associated release or delivery activities.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
8.5.3	Procedure for the management of customer property - If your organisation takes control of property (including data) belonging to your customers or other third-party organisations during the process of producing your products or services, then you will want to properly identify and record details of such property and ensure that it is properly managed and protected. This applies to property which is provided (a) for incorporation within your products or services, as well as (b) that which is to be returned to its owner at an agreed future date.				
8.5.6	Records of production or service provision changes - During the production of goods or the provision of services, there may be circumstances where changes may be identified as needed to ensure that your organisation can continue to meet product/service specifications, contractual requirements or other external factors. As such changes are identified, they need to be recorded, and then passed to suitable persons to undertake a proper assessment and consideration for authorisation (or rejection).				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
8.7 and 10.2	Records of non-conformities and results of corrective actions - Non-conformities can arise from different sources. For example, product inspections or measurements, activity monitoring, internal audit reports or customer feedback or complaints. All non-conformities should be documented as part of your QMS, and actions are undertaken to minimise their effect on your organisation, its products, systems and your customers. Prompt remedial actions should be identified and undertaken which are both effective and permanent, with the aim that the non-conformity should be prevented from happening again.				
9.1.1	Records of monitoring and measurement activities - Component activities within your QMS need to be capable of being monitored and measured, so you will be able to understand whether your organisation's efforts are effective and supporting the achievement of its quality objectives. This document should record the various quality-related activities that are being undertaken, and determine how they can be managed and reviewed to ensure that they remain both effective and relevant to the QMS.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
9.1.2	Records of customer feedback - On a regular basis, your organisation should reach out to its customers (or a subset of them) to assess their level of satisfaction with your organisation's performance, and specifically to check whether your products/services are meeting their expectations. This activity could be conducted by questionnaire, phone interview, during meetings with customers, or by assessing praise or complaints received. Records of this activity will be useful inputs to many other parts of your QMS.				
9.2	Internal audit procedure and internal audit reports - Each ISO management system standard requires an organisation to plan for and undertake regular internal audits, to ensure that it is regularly checking how well it is performing. Your organisation's internal audit activities for your QMS should be planned in advance. The results of each internal audit activity should be documented and reviewed, such that any corrective actions or improvement opportunities can be identified, recorded and implemented as required.				

Clause	Description	Our Status	Owner	Target Date	Completed? (Y/N)
9.3	Management review procedure and minutes of review meetings - Your organisation's top-level management should undertake periodic assessments of your QMS, following an agreed procedure. This will allow them visibility of the component activities of your QMS, including data from activity monitoring, details of non conforming products, internal audit results, etc. Top level management will be able to act upon this information, perhaps focusing resources and support where it is most needed. The results (minutes) of management reviews need to be documented.				
10.3	Records of continual improvement activities - There are many activities and supporting records which will provide evidence of continual improvement activities being implemented within your organisation. These may include audit findings, details of non-conforming products, customer complaints, data breaches or simply feedback from your personnel or interested parties, amongst others. The best practice is for the source of identified improvements to be recorded, which can then be supported by records of what is subsequently done to effectively implement improvement actions which address the underlying root causes.				

Getting ready for ISO 9001 certification

Feeling a little overwhelmed? Don't worry - we're here to help. Whatever your level of experience or readiness for ISO 9001, take a look at some of our helpful resources that you can use to support your journey to certification.

Training

Did you know we're experts in ISO Training? From free introductory training to comprehensive internal auditor courses, or bespoke ISO training designed specifically for your business, our expert trainers deliver professionally designed courses to help you get the most out of ISO certification for your business. View our [training courses](#) to find out more.

Insights, Guides & Videos

If you'd like to learn more about ISO certification, our website is full of useful resources and material. From ISO articles aimed at particular industries to FAQs, checklists and helpful insights and tips, check out our [resources section](#) to discover this helpful information.

Software

British Assessment Bureau offers new ISO certification clients free access to our certification management system software, worth over £1,100. This user-friendly software solution features essential tools and resources like checklists and templates to simplify building and managing your ISO management system. View more information [here](#).
